

Making Copilot Agents Produce On-Brand Content

A HackPack reference guide — how to get Microsoft 365 Copilot (and agents you build with **Agent Builder**) to follow a **style guide** and use your **PowerPoint templates**, plus a clear map of what Agent Builder *can* and *can't* do.

TL;DR - Style guide (tone, terminology, format):  **easy.** Add it as a **Knowledge** source and enforce it in **Instructions**. - **A real .potx PowerPoint template:**  **not from an Agent Builder agent itself.** Use **PowerPoint Copilot** with a SharePoint **Organization Asset Library (OAL)** (admin setup) or **Copilot Cowork** (attach a personal .potx). - **Writing back to M365 (Planner tasks, Teams posts, calendar):**  **not in Agent Builder.** That requires **Copilot Studio** actions or a pro-code **Agents Toolkit** API plugin.

1. What Agent Builder actually gives you

An agent built with **Agent Builder** in Microsoft 365 Copilot is a **declarative agent** = **Instructions** + **Knowledge** + a few built-in **Capabilities**.

Part	What it does	Good for
Instructions	Natural-language rules for behavior, tone, format	Enforcing a style guide, response shape
Knowledge	Read-only grounding: SharePoint/OneDrive files, Copilot (Graph) connectors, web	Feeding the agent your style guide, reference docs
Capabilities	Built-in toggles: <i>Create documents/charts/code, Create images</i>	Generating drafts, decks, visuals

The ceiling: Agent Builder has **no Actions**. Microsoft's own doc says: "*If you need more advanced capabilities like Actions to integrate external services, use Microsoft Copilot Studio.*" So an Agent Builder agent can **read/ground and generate**, but it **cannot write** to Planner/Teams/calendar and **cannot bind** a specific .potx template.

2. Enforce a style guide

Two levers, used together:

- Step 1 — Add the style guide as Knowledge.** Put the Word/PDF style guide somewhere the agent can read (SharePoint or OneDrive), then add it under **Knowledge**.
- Step 2 — Restate the non-negotiables in Instructions and reference the doc.** Per Microsoft guidance: *always specify tone, verbosity, and output format*, write in **Markdown**, and **bold** critical rules.

```
## Style rules (always apply)
- **Always follow the "Contoso Content Style Guide"** knowledge file for voice, terminology,
- **Tone:** professional, concise, active voice.
- **Headings:** Title Case. **Never** use exclamation points.
- Approved terms: "teammate" (not "employee"); "Copilot" (not "the AI").
- For decks, follow this section order: Title → Agenda → Context → Recommendation → Next Steps
```

3. Use your PowerPoint template ⚠️ (three routes)

Route	Applies your .potx?	Who sets it up	Notes
Agent Builder agent	❌ No	—	No mechanism to bind a template
PowerPoint Copilot + SharePoint OAL	✅ Yes	Admin (tenant-wide)	Templates appear in the Copilot "create new presentation" picker
Copilot Cowork	✅ Yes	You (personal) or admin	Attach a .potx (or drop it in OneDrive root) and tell Cowork to use it — no admin needed

What carries through from a template (verified by Microsoft for Cowork): theme palette, brand fonts, logos, **all named layouts + slide master**, and slide geometry/placeholder positions — Cowork rewrites the *text* and leaves the *design* intact.

4. Admin setup — SharePoint Organization Asset Library (for templates)

- One-time, via the **SharePoint Online Management Shell** (requires **SharePoint Administrator**). There is no admin-center UI toggle for this.
- Pick/create one SharePoint site** for org assets. ⚠️ *All* org asset libraries must live on the **same site**.
 - Create a document library** and **upload your templates** — PowerPoint .potx (Word .dotx , Excel .xltx).
 - Install the latest **SharePoint Online Management Shell** (uninstall older versions first).

4. Connect as a SharePoint Administrator: `powershell Connect-SPService -Url https://<tenant>-admin.sharepoint.com`
5. Register the library as a **template** library (`-OrgAssetType OfficeTemplateLibrary` is the key — without it, it defaults to an image library): `powershell Add-SPOrgAssetsLibrary ` -LibraryUrl https://contoso.sharepoint.com/sites/branding/Templates ` -ThumbnailUrl https://contoso.sharepoint.com/sites/branding/Templates/contosologo.jpg ` -OrgAssetType OfficeTemplateLibrary ` -CdnType Private`

Want both approved **images** and **templates**? Use `-OrgAssetType ImageDocumentLibrary,OfficeTemplateLibrary` . Convert an existing library later: `Set-SPOrgAssetsLibrary -LibraryUrl <url> -OrgAssetType OfficeTemplateLibrary` .

Then, as an end user: PowerPoint → **New** → **Create with Copilot** → choose a template from **your organization's collection**. The deck is generated on-brand.

Requirements & gotchas

- **OrgAssetType** values: `ImageDocumentLibrary` , `OfficeTemplateLibrary` , `OfficeFontLibrary` , `BrandKitLibrary` (combinable).
- Up to **30** libraries, all on the **same site**; **allow up to 24 hours** to appear.
- Users need **read** on your org **root site**.
- PowerPoint **on the web** requires **Office 365 E3/E5**; desktop needs **Microsoft 365 Apps v2002+**.
- Publishing a `.potx` to the OAL feeds **both** PowerPoint Copilot's picker **and** Copilot Cowork.

5. Writing back to M365 (Planner, Teams, Calendar) ❌ in Agent Builder

Any **write** action has the same ceiling as templates — not available in Agent Builder. Options one tier up:

Need	Path
Add a Planner task	Copilot Studio → Planner connector action, <i>or</i> Agents Toolkit API plugin over Microsoft Graph <code>POST /planner/tasks</code>
Post a Teams channel message	Copilot Studio → Teams connector ("Post message..."), <i>or</i> Graph <code>POST /teams/{id}/channels/{id}/messages</code>
Read Teams "Updates" submissions	<i>Updates App (Microsoft 365)</i> connector is trigger-only (no read action) — trigger → persist to Dataverse/SharePoint → read
